- 1. Develop a Program in C for the following:
- A. Declare a calendar as an array of 7 elements (A dynamically Created array) to represent 7 days of a week. Each Element of the array is a structure having three fields. The first field is the name of the Day (A dynamically allocated String), the second field is the date of the Day (A integer), the third field is the description of the activity for a particular day (A dynamically allocated String).
- B. Write functions create(), read() and display(); to create the calendar, to read the data from the keyboard and to print weeks activity details report on screen.

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <ctype.h>
#define NUM DAYS IN WEEK 7
// Structure to represent a day
typedef struct
      char *acDayName;
      int iDate;
      char *acActivity;
       } DAYTYPE;
      void fnFreeCal (DAYTYPE *);
       void fnDispCal (DAYTYPE *);
       void fnReadCal (DAYTYPE *);
       DAYTYPE *fnCreateCal();
